

BLASTRADIUS FOR IBM BOB

Review the blast radius,
not the diff.

IBM Bob 2.0 Hackathon · workflow: code review

The diff shows nineteen tidy files. *It can't show the caller it missed.*

- Reviewers read diffs. Damage lives in callers, other subsystems and team rules.
- Same-typed arguments swapped: TypeScript passes, CI is green.
- The bug ships and the team pays for it in rework.

The diff shows nineteen tidy files. *It can't show the caller it missed.*

BlastRadius maps what a PR can break, *and IBM Bob reviews with the map.*

ENGINE

Code graph in under a second

tree-sitter over git refs. Dependents, subsystems, signature changes, missed callers, untested units, ADRs in scope. A 0–100 score with a reason for every point.

IBM BOB

The reviewer

MCP server, BlastRadius Reviewer mode and skill. Stops for a human, reads ADRs, sends a subagent into each subsystem, proposes fixes.

PROOF

Tests that ran

Subagents write vitest regression tests against a real in-memory database. A red test is a finding. Granite on watsonx.ai writes the summary.

Every Bob feature *does a job.*

MCP server	<code>analyze_pr</code> <code>get_dependents</code> <code>get_subsystem</code> <code>check_docs</code> <code>run_tests</code> + 3 more
Custom mode + rules	BlastRadius Reviewer: evidence rules, stop at score ≥ 70 or a missed caller, edits limited to tests and approved fixes
Skill	<code>blast-radius-review</code> : the 9-step procedure, reusable from any mode
Parallel subagents	One per risky subsystem, each writes and runs one regression test
Document understanding	Judges each ADR rule with the file and line
/init · /review · Bob Shell	AGENTS.md written by Bob · Bob reviews this repo · <code>bob run</code> in GitHub Actions

Task archiving + getWorkspaceMember refactor

95

CRITICAL

diff 19 files · radius 20 files · 968 ms

reach		25/25
	19 dependent units (19 direct, 18 of them edited in this PR)	
spread		15/15
	9 subsystems touched	
criticality		15/15
	changes getWorkspaceMember	
contract		10/10
	1 exported signature change(s)	
missed callers		15/20
	1 caller(s) not updated for a changed signature	

CALLER LEFT BEHIND

```
api/.../projects/[projectId]/tasks/[taskId]/comments/[commentId]/route.ts:18
```

```
getWorkspaceMember(workspaceId, user.id)
```

Bob found both hidden bugs, *with tests it ran.*

21

files in the diffs

56

files in the blast radius

- PR-1 copy change: risk 6, approved in one pass. PR-2, three lines: risk 70, 34 units in 13 subsystems.
- PR-3: risk 95. Missed caller at `comments/[commentId]/route.ts:18`: test red (403), fixed, green. ADR-002 violation caught.

Less rework, *fewer bugs that pass CI*.

- Reviewers start from what the change can break. Every finding carries a file and line, so there is nothing to argue about.
- The evidence is deterministic and takes under a second. The model only explains it, so a flaky model can't turn a risky PR green.
- One engine, three places: Bob IDE for reviewers, the CLI for developers, CI with a merge gate and Bob Shell.
- Next: more languages, and a history of past reviews Bob can query through MCP.

BLASTRADIUS

Review what it *breaks*.
